

PENTACOMPILER

BY

TEAM

**Gabriel Hernández
Yukioayax Canek
321058526**

Project Manajer

The heart and soul of the company. Also a person who comes up with an idea and then transforms it to real life.

**Atilano Velázquez
Leonardo
321331656**

Requirements Analyst

Gathers, analyzes, and documents stakeholder needs, translating them into clear, testable technical requirements for the compiler development team.

**Sánchez Bautista
Luis Yael
321184995**

Software Architect

Designs the overall system architecture, defines technology stack and design patterns, ensuring scalability, maintainability, and software quality.

**Trejo Olvera
Emmanuel
424138220**

Lead Developer

Implements compiler functionalities according to defined requirements, follows coding best practices, and actively collaborates with the technical team.

**Uribe Vázquez
Rodrigo
320560154**

Tester (QA)

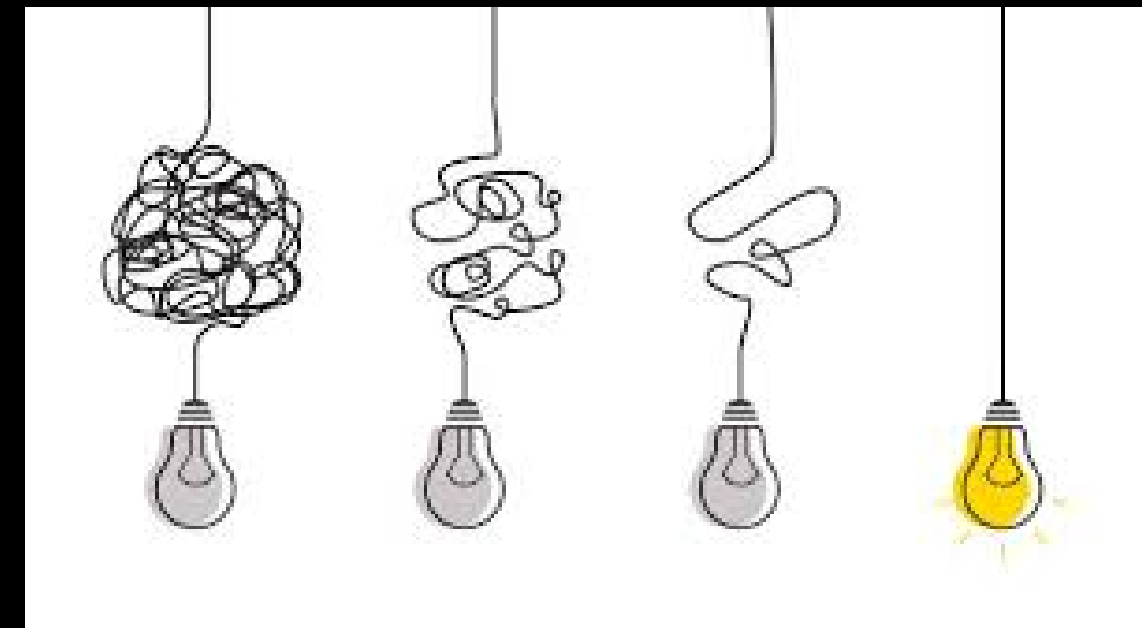

Evaluates applications to identify bugs, errors, or gaps in requirements before the product reaches the end user.

THE CORE PROBLEM

Many compilers generate unclear or overly technical error messages, making it difficult for the developer to quickly identify the cause of the problem.

Some compilers require a large amount of memory and processing during compilation, especially in large projects.

Many traditional compilers have complex or closed internal architectures. This limits the ability to adapt the compiler to specific needs.

THE COMPETITION

Tradicional Compilers

High Performance / High Complexity

Dynamic Interpreters

Low Performance / High Simplicity

PentaCompiler

Optimal Balance

PentaCompiler bridges the gap between the power of a compiled language and the agility of a modern educational tool.

OUR SOLUTION

PentaCompiler modernizes the compilation process through a modular architecture capable of analyzing code and explaining errors in a clear and understandable manner.

The tool allows for the visualization of data flow, dependencies, and variable management, helping to prevent errors and improve program comprehension.

Furthermore, it facilitates automatic documentation and reduces technical debt, enabling new developers to quickly understand the codebase and boost their productivity from the early stages of development.

CENTRAL MODULES

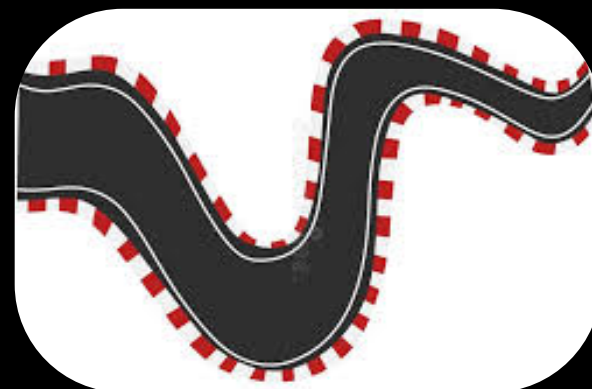

Front-End

Lexical and syntactic analyzer based on context-free grammars for absolute precision.

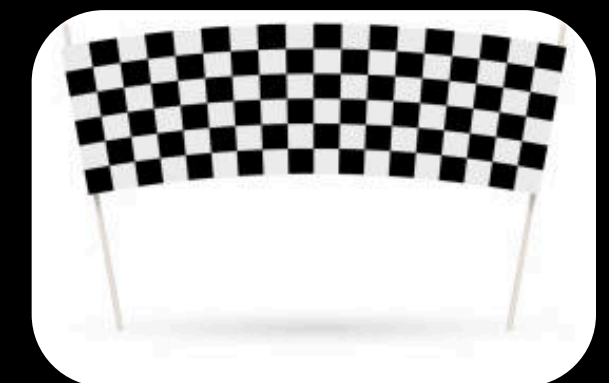

Middle-End

Optimization of data structures and efficient memory management for abstract data types.

Back-End

Code generation and direct interconnection (linker) with processor registers for maximum speed.
